What is Cetilistat?

Called Cetilistat, Celestal, and Cetilistast, and its molecular formula is C₂₅H₃₉NO₃.

Cetilistat is a drug or food compound for the treatment of obesity.

Its mechanism of action is similar to that of the marketed drug orlistat by inhibiting "pancrelipase", which is an enzyme that breaks down triglycerides in the intestines. Without this enzyme, "triglycerides" in the diet can prevent food nutrients from being hydrolyzed into absorbable free fatty acids, and excretion of food nutrients that have not been absorbed.

Function of Cetilistat

Cetilistat restricts pancreatic lipases and acts as an agent to treat obesity and related diabetes or dyslipidemia. It results in weight loss and absorbs fat from diet. The drug acts peripherally to reduce the appetite, without affecting the brain.
